Case Fatality Rate: Percentage of COVID-19 cases resulting in death

Source: Bureau of Vital Records and Health Statistics and Infectious Disease Epidemiology Bureau, Epidemiology and Response Division, reporting through 5.10.2020, New Mexico Department of Health.
COVID-19 Case-fatality rates (CFR) by age group

- <65: 1.2%
- 65-74: 8.4%
- 75-84: 17.0%
- 85+: 28.0%
COVID-19 Case-fatality rates (CFR) by race/ethnicity

- AIAN: 3.4%
- Asian/NHOPI: 2.1%
- Black/AfAm: 1.4%
- Hispanic: 3.0%
- White: 8.4%
- Other/Unknown: 1.5%
Key points

- Prevalence rates have increased across all regions since last week
  - Closely monitor the SW region in the coming weeks

- Regionally, NW’s prevalence rates are the highest followed by Metro and SW
  - With exception of NW region, the prevalence rates are similar from 15-44+ age groups, but the 15-44 age group may need to be further sub-grouped

- Shortest doubling times reflect high prevalence rates in the NW and Metro regions and longest doubling times are in the SE and NE regions

- Hospitalization rate is highest in NW region
  - Counties in the NW region have the highest number of hospitalized cases per 100,000 population
  - Hospitalized case rates >50 per 100,000 in age groups >55 years old
  - AI/AN have highest rate of hospitalized cases followed by Black or African American and Hispanic or Latino
  - Ventilator use rate has been steady at ~25% of hospitalized cases since mid-April

- Mortality rate is highest in NW region
  - Overall, age group 85+ is highest

- Case fatality rate (CFR)
  - NW and Metro regions have the highest and similar CFRs
  - Highest in age group 85+
  - Highest in White race/ethnicity group followed by AI/AN
COVID-19 in New Mexico: modeling update

As of May 5 and May 12, 2020
Epidemiology & Response Division
Improvements in the reduction of COVID has plateaued

- Statewide R_effective improvements have now plateaued.

- Additional actions will be necessary to reduce transmission of COVID-19.

Courtesy of Presbyterian Healthcare Services - May 12, 2020.
Simulating reductions in social distancing

Scenario 1

• No relaxation in social distancing
• Current $R_{\text{effective}}$ remain constant with no further improvements

Scenario 2

• Social distancing begins May 20\textsuperscript{th} causing NM to lose 20\% of the improvements gained since April 1\textsuperscript{st} in control over COVID
• Relaxation stays for 60 days then we reinstitute current social distancing
• NOTE: the 20\% loss is an illustration, actual changes will be measured to understand effect

Implications

• Peak in simultaneous patients in ICUs increases by 50\% and duration of surge more than doubles
• This estimate is illustrative only. We will observe any actual changes in the effective rate of to determine impact changing social distancing policies and practices.
